

Instructions for Replacement of Connector for Figs. 1189/1190 Watertight Deck Connection

This package contains two connector versions. Choose the correct connector for your application.

Option 1

Diagram 1A

Discontinued old style press-fit female connection

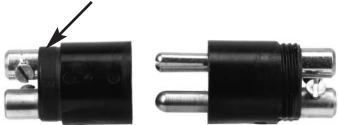

If you have this version, the replacement connector will not mate with the old installed connector.

Push out the old connector. Push in the female side of the new connector that has been specifically machined to remove the threads. Be sure it is fully seated into the metal flange.

Has no threads here

Female Side
Un-threaded

Male
Side

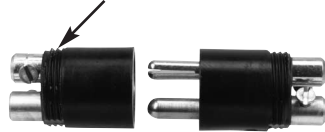

Shows press-fit female socket installed

Option 2

Diagram 2A

Has threads here

Female Side
Threaded

Male Side
Threaded

Diagram 2B

New style threaded female connector

If you have this version and must replace the female connector in the metal flange:

Unscrew the old connector. Put a small amount of caulking or adhesive on the threads of the new connector and screw it into the flange. Align the wire terminals to the flange as shown in Diagram 2B before the adhesive sets. The metal flange is threaded at the very end of the body to mate with the connector.
